BERNSTEIN'S INEQUALITY IN LP FOR 0 < p < 1

Paul G. Nevai

Technical Summary Report # 1728 February 1977

ABSTRACT

Let $0 and <math>T_n$ be a trigonometric polynomial of order n.

Then

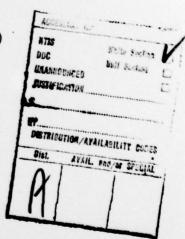

$$\int_{-\pi}^{\pi} \left| T_n'(t) \right|^p dt \le \frac{4e}{p} n^p \int_{-\pi}^{\pi} \left| T_n(t) \right|^p dt.$$

A similar inequality is established for algebraic polynomials in weighted $\begin{array}{c} L \\ p \end{array}$ spaces.

AMS (MOS) Subject Classification: 42A04

Key Words: Bernstein's inequality

Work Unit Number 6 (Spline Functions and Approximation Theory)

BERNSTEIN'S INEQUALITY IN LP FOR 0 < p < 1

Paul G. Nevai

One of the most powerful tools in approximation theory is Bernstein's inequality:

which holds for $1 \le p \le \infty$ with C(p) = 1. Here T_n is an arbitrary trigonometric polynomial of order n.

The main purpose of the present note is to prove the following

Theorem 1. Let $0 . Then Bernstein's inequality (1) is satisfied with <math>C(p) = 4ep^{-1}$.

If T_n is a trigonometric polynomial of order n then convolving T_n with D_n we get T_n , that is $T_n = T_n * D_n$. Hence $T_n' = T_n * D_n'$. Therefore we have the following two inequalities

(2)
$$|T_n(x)| \le \frac{2n+1}{2\pi} \int_{-\pi}^{\pi} |T_n(t)| dt$$

and

(3)
$$|T_n^i(x)| \leq \frac{n(n+1)}{2\pi} \int_{-\pi}^{\pi} |T_n(t)| dt$$
.

Now let 0 . We obtain from (2)

$$\max_{\|x\| \le \pi} |T_{n}(x)| \le \frac{2n+1}{2\pi} \int_{-\pi}^{\pi} |T_{n}(t)|^{p} dt \max_{\|x\| \le \pi} |T_{n}(x)|^{1-p},$$

Sponsored by the United States Army under Contract No. DAAG29-75-C-0024 and by the National Science Foundation under Grant No. MPS 75-06687.

that is

$$|T_{n}(x)|^{p} \leq \frac{2n+1}{2\pi} \int_{-\pi}^{\pi} |T_{n}(t)|^{p} dt$$
.

Thus by (3)

$$\begin{split} |T_{n}'(x)| &\leq \frac{n(n+1)}{2\pi} \int_{-\pi}^{\pi} |T_{n}(t)|^{p} dt \left[\max_{|x| \leq \pi} |T_{n}(x)|^{p} \right]^{\frac{1-p}{p}} \leq \\ &\leq \frac{n(n+1)}{2\pi} \int_{-\pi}^{\pi} |T_{n}(t)|^{p} dt (2n+1)^{\frac{1-p}{p}} \left[\frac{1}{2\pi} \int_{-\pi}^{\pi} |T_{n}(t)|^{p} dt \right]^{\frac{1-p}{p}} . \end{split}$$

Hence

$$\big|T_{n}'(x)\big|^{p} \leq n^{p}(n+1)^{p}(2n+1)^{1-p} \ \frac{1}{2\pi} \ \int_{-\pi}^{\pi} \ \big|T_{n}(t)\big|^{p} dt \ .$$

Now comes the trick. Let $k=\left[\frac{2}{p}\right]+1$ and put here $T_n(t)D_n^k(x-t)$ instead of T_n . $T_nD_n^k$ is of order n(k+1). Therefore

$$\begin{split} & \big| T_n^{\prime}(x) (2n+1)^k - k(2n+1)^{k-1} D_n^{\prime}(0) T_n(x) \big|^p \leq \\ & \leq n^p (k+1)^p \big[\, n(k+1) + 1 \big]^p \big[\, 2n(k+1) + 1 \big]^{1-p} \, \frac{1}{2\pi} \int_{-\pi}^{\pi} \, \big| T_n(t) \big|^p \big| \, D_n(x-t) \, \big|^{kp} dt \; . \end{split}$$

Using $D_n^i(0) = 0$ and $kp \ge 2$ we get

$$\left|T_{n}'(x)\right|^{p} \leq n^{p}(k+1)^{p}(2n+1)^{-2}[n(k+1)+1]^{p}[2n(k+1)+1]^{1-p} \cdot \frac{1}{2\pi} \int_{-\pi}^{\pi} \left|T_{n}(t)\right|^{p} D_{n}^{2}(x-t) dt \ .$$

Integrating this inequality we obtain

$$\int_{-\pi}^{\pi} \left| T_{n}^{*}(x) \right|^{p} dx \leq n^{p} (k+1)^{p} (2n+1)^{-1} [n(k+1)+1]^{p} [2n(k+1)+1]^{1-p} \cdot \int_{-\pi}^{\pi} \left| T_{n}(t) \right|^{p} dt \ .$$

Let m be a natural integer. Apply this inequality to $T_n(mx)$ instead of $T_n(x)$, divide by m^p and let $m \to \infty$. The result is

$$\int_{-\pi}^{\pi} \left| T_{n}'(x) \right|^{p} \! dx \leq (k+1)^{1+p} 2^{-p} n^{p} \int_{-\pi}^{\pi} \left| T_{n}(t) \right|^{p} \! dt \ .$$

Recall that $k \le 2p^{-1} + 1$. Thus the theorem follows.

Let us note that it would be of definite interest to find the exact value of the constant factor C(p). There are several consequences and possible generalizations of our result.

In the following we will establish weighted Bernstein inequalities for algebraic polynomials. Denote $p_n(\alpha, \beta, x) = \gamma_n(\alpha, \beta) x^n + \cdots$ the orthonormed Jacobi polynomials and let

$$K_n(\alpha, \beta, x) = \sum_{j=0}^{n-1} p_j^2(\alpha, \beta, x)$$
.

<u>Lemma 2</u>. Let $\alpha > -1$, $\beta > -1$, $\gamma > -1$, $k = 0,1,\ldots$, $\ell = 0,1,\ldots$, $m = 0,1,\ldots$ and $0 < \epsilon < 1$ be fixed. Put

(4)
$$P(x) = n^{-2}x^{k}(1-x)^{\ell}(1+x)^{m}K_{n}(\alpha,\beta,x)K_{n}(-\frac{1}{2},\gamma,2x^{2}-1)$$

for $n = 1, 2, \ldots$ Then

(5)
$$|P'(x)| \le C_1 |x|^{-1} (1-x^2)^{-1} |P(x)|$$

for |x| < 1 and

(6)
$$0 < C_2 \le |P(x)| |x|^{-k+2\gamma+1} (1-x)^{-\ell+\alpha+\frac{1}{2}} (1+x)^{-m+\beta+\frac{1}{2}} \le C_3 < \infty$$

for $\epsilon n^{-1} \le |x| \le 1 - \epsilon n^{-2}$ where C_1 , C_2 and C_3 do not depend on x and n.

<u>Proof.</u> First let us calculate $K_n^i(\alpha, \beta, x)$. By the Christoffel-Darboux formula we have

$$K_{\mathbf{n}}(\alpha,\beta,\mathbf{x}) = \frac{Y_{\mathbf{n}-1}(\alpha,\beta)}{Y_{\mathbf{n}}(\alpha,\beta)} \left[p_{\mathbf{n}}^{\dagger}(\alpha,\beta,\mathbf{x}) p_{\mathbf{n}-1}(\alpha,\beta,\mathbf{x}) - p_{\mathbf{n}-1}^{\dagger}(\alpha,\beta,\mathbf{x}) p_{\mathbf{n}}(\alpha,\beta,\mathbf{x}) \right].$$

Hence

$$K_{\mathbf{n}}^{\prime}(\alpha,\beta,\mathbf{x}) = \frac{Y_{\mathbf{n}-1}(\alpha,\beta)}{Y_{\mathbf{n}}(\alpha,\beta)} \left[p_{\mathbf{n}}^{\prime\prime}(\alpha,\beta,\mathbf{x}) p_{\mathbf{n}-1}(\alpha,\beta,\mathbf{x}) - p_{\mathbf{n}-1}^{\prime\prime}(\alpha,\beta,\mathbf{x}) p_{\mathbf{n}}(\alpha,\beta,\mathbf{x}) \right].$$

Note that $p_n(\alpha, \beta, x)$ satisfies the differential equation

$$(1 - x^2)Y'' = -n(n + \alpha + \beta + 1)Y + [\alpha - \beta + (\alpha + \beta + 2)x]Y'$$
.

Therefore we obtain

$$K_{\mathbf{n}}^{\prime}(\alpha,\beta,\mathbf{x}) = \frac{\alpha-\beta+(\alpha+\beta+2)\mathbf{x}}{1-\mathbf{x}^2} K_{\mathbf{n}}^{\prime}(\alpha,\beta,\mathbf{x}) - \frac{\gamma_{\mathbf{n}-\mathbf{1}}(\alpha,\beta)}{\gamma_{\mathbf{n}}^{\prime}(\alpha,\beta)} \frac{2\mathbf{n}+\alpha+\beta}{1-\mathbf{x}^2} p_{\mathbf{n}-\mathbf{1}}^{\prime}(\alpha,\beta,\mathbf{x}) p_{\mathbf{n}}^{\prime}(\alpha,\beta,\mathbf{x}) \ .$$

It has been shown in [2] that

$$n | p_{n-1}(\alpha, \beta, x) p_n(\alpha, \beta, x) | \le \text{const } K_n(\alpha, \beta, x)$$

for |x| ≤1. Thus

$$|K_{\mathbf{n}}^{\mathbf{I}}(\alpha, \beta, \mathbf{x})| \leq \operatorname{const}(1 - \mathbf{x}^{2})^{-1}K_{\mathbf{n}}(\alpha, \beta, \mathbf{x})$$

for $|\mathbf{x}| \le 1$ which yields (5) by a simple computation. Concerning (6) see e.g. [2], § 6.3. Lemma 3. Let $\alpha > -1$, $\beta > -1$, $\gamma > -1$ and $0 . Then there exists a number <math>\delta > 0$ such that for every polynomial π_n of degree at most n

$$\int_{-1}^{1} |\pi_{n}(t)|^{p} (1-t)^{\alpha} (1+t)^{\beta} |t|^{\gamma} dt \leq 2 \int_{\frac{\delta}{n} \leq |t| \leq 1 - \frac{\delta}{n^{2}}} |\pi_{n}(t)|^{p} (1-t)^{\alpha} (1+t)^{\beta} |t|^{\gamma} dt .$$

This lemma has been proved in [2], § 6.3.

<u>Lemma 4</u>. Let $0 , <math>0 < \epsilon < l$. Let a, b and c be given real numbers. Then there exist two constants $\delta > 0$ and C_4 such that for every polynomial π of degree at most n the inequality

$$\int\limits_{n}^{} \frac{|\pi_{n}^{\prime}(t)\sqrt{1-t^{2}}|^{p}(1-t)^{a}(1+t)^{b}|_{t}|^{c}dt}{\sum\limits_{n}^{} \leq |t| \leq 1-\frac{\delta}{n^{2}}} \frac{|\pi_{n}(t)|^{p}(1-t)^{a}(1+t)^{b}|_{t}|^{c}dt}{\sum\limits_{n}^{} \leq |t| \leq 1-\frac{\delta}{n^{2}}}$$

holds.

<u>Proof.</u> If $a = b = -\frac{1}{2}$ and c = 0 then the lemma follows from Bernstein's inequality $(1 \le p < \infty)$, Theorem 1 $(0 and Lemma 3. Otherwise we choose <math>\alpha$, β , γ , k, ℓ and m so that they satisfy the conditions of Lemma 2, further $a = p(\ell - \alpha - \frac{1}{2}) - \frac{1}{2}$, $b = p(m - \beta - \frac{1}{2}) - \frac{1}{2}$ and $c = p(k - 2\gamma - 1)$. Let P be defined by (4). Then $P\pi_n$ is of

degree 5n + k + l + m = O(n). Applying the case $a = b = -\frac{1}{2}$, c = 0 to $P\pi_n$ instead of π_n we easily obtain the lemma.

Lemmas 3 and 4 combined give us the following

Theorem 5. Let $0 . Let <math>1 = x_1 > x_2 > \dots > x_N = -1$, $y_i > -1$ and $\Gamma_i \in \mathbb{R}$ for $i = 1, 2, \dots, N$. Let

$$W(t) = \prod_{i=1}^{N} |t - x_i|^{\gamma_i}$$

and

$$W_{n}(t) = (\sqrt{1-t} + \frac{1}{n})^{2\Gamma_{1}} \prod_{i=2}^{N-1} (|t - x_{i}| + \frac{1}{n})^{\Gamma_{i}} (\sqrt{1+t} + \frac{1}{n})^{2\Gamma_{N}}.$$

Then for every polynomial π_n of degree at most n

$$\int_{-1}^{1} |\pi_{n}^{t}(t) \sqrt{1-t^{2}}|^{p} W_{n}(t) W(t) dt \leq C_{5} n^{p} \int_{-1}^{1} |\pi_{n}(t)|^{p} W_{n}(t) W(t) dt$$

where C, is independent of n.

Let us remark that Theorem 5 is new only for $0 . For <math>1 \le p < \infty$ it was proved in [2]. Even for the case $1 \le p < \infty$ the present proof is much simpler than that in [2]. There is an extensive literature dealing with N = 2, that is when W is a Jacobi weight. We refer the reader to [1] where a great number of works on weighted Bernstein inequalities is mentioned in the references.
